

# SUSPENSION STRAP

**Accen rescue straps are an auxiliary device for an employee who is hanging in the safety harness.**

Rescue straps are attached to carrying straps on the safety harness. In case of a fall, when the victim is conscious, the pressure of the femoral straps of the harness on the arteries may cause a cardiac arrest within a few minutes. Rescue straps are hidden in small containers, after unrolling and shortening, the injured person can conveniently insert both legs into the straps, relieving pressure on femoral arteries.
